  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score

1. FUNCTION: Catalyzes the oxidation of cytokinins, a family of N(6)-substituted adenine derivatives that are plant hormones, where the substituent is an isopentenyl group.

1. CATALYTIC ACTIVITY: N6-(3-methylbut-2-enyl)adenine + H(2)O + adenine + 3-methylbut-2-enpl + H(2)O(2).

1. COFACTOR: FAD (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Jusaki T., Matsumoto T., Submitted (JUL-2000)

Cleaves zeatin, isopentenyladenine, isopentenyladenosine, zeatin riboside and ciszeatin, but not dihydrozeatin, kinetin and benzylaminopurine. CATALYTIC ACTIVITY: N6 (3:methybut-2-enyl)adenine + H(2)0 + O(2) adenine + 3-methylbut-2-enal + H(2)0(2).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PTM: Glycosylated, with SIMILARITY: Belongs to t

"Evidence for the expression of three genes encoding homologous
atrial gland peptides that cause egg laying in Aplysia.";
J. Biol. Cohem. 261:7853-7859(1986)
-i- FUNCTION: INJECTED IN SEXUALLY MATURE ANNIMALS CALIFIN B EXCITES
LB AND LC CELLS OF THE ARDOMINAL GANGLION AND CAUSE EGG-LAYING.
-i- SUBUNIT: THIS PROTEIN CONSISTS OF A LARGE 36-RESIDUE SUBUNIT,
BOUND BY A SINGLE DISCUFTIDE-BOND TO A SMALL 18-RESIDUE SUBUNIT.
-i- MISCELLANEOUS: CALIFIN B PROBABLY DERIVES FROM POLYPROTEIN B,
WHICH IS ALSO THE PRECURSOR FOR PEPTIDE B.
-i- SIMILARITY: TO ELH/ACIDIC PEPTIDE.

FUNCTION: THE ATRIAL GLAND PEPTIDE A & PEPTIDE B PRECURSORS ARE TURE SOURCE OF THE 2 PEPTIDES THAT, UPON RELEASE FROM THIS REPRODUCTIVE SYSTEM GLAND, INITIATE THE EGG-LAYING PROCESS BY EXCITING THE BAG CELL NEURONS. THESE NEURONS, CLUSTERED IN NEURAL CONNECTIVES NEAR THE ABDOMINAL HEADLION, IN TURN RELEASE OTHER PEPTIDES THAT ACT DIRECTLY ON THE GANGLION & ALSO, VIA THE CIRCULATING HEMOLYMPH, ON MANY OTHER ORGANS TO CONTROL THE PHYSIOLOGICAL PROCESSES OF EGG-LAYING. ONE OF THESE OTHER PEPTIDES
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DXDXSXFXGXX 11

Submitted (AUG-1997) to the EMBL/GenBank/DDBJ databases.
-I- FUNCTION: CENTRAL COMPONENT OF THE RECEPTOR COMPLEX RESPONSIBLE
FOR THE RECOGNITION AND TRANSLOCATION OF CYTOSOLICALLY SYNTHESIZED
MITOCHONDRIAL PREPROTEINS (BY SIMILARITY).
-I- SUBUNIT: FORMS PART OF THE RECEPTOR COMPLEX THAT CONSISTS OF AT
LEAST 8 DIFFERENT PROTEINS (BY SIMILARITY).
-I- SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN. MITOCHONDRIAL
OUTER MEMBRANE (BY SIMILARITY).
-I- SIMILARITY: TO YEAST TOM22.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Putative mitochondrial import receptor subunit (Mitochondrial 22 kDa outer membrane protein) (Translocase of outer membrane 22 kDa subunit) (MASI7 protein) (Mitochondrial 17 kDa assembly protein).
